Important notes

- 1. All endpoints use **application/json** content type in requests and responses
- 2. Current version of API doesn't require user authentication

Payment API Endpoints

Create Payment Endpoint

Path: [/payments/v1/payment](#)
Method: POST
Parameters: -
Request Body: Payment object (**required**)

| Responses | Code | Description | Body |
|-----------|------|-----------------|------|
| | 201 | payment created | - |
| | 400 | invalid content | - |
| | 500 | server failure | - |

Additional Response header includes payment location URL
Payment id and version values in the body are ignored on the server and reset

Update Payment Endpoint

Path: </payments/v1/payment>
Method: PUT
Parameters: -
Request Body: Payment object (**required**)

| Responses | Code | Description | Body |
|-----------|------|-------------------|------|
| | 200 | payment updated | - |
| | 400 | invalid content | - |
| | 404 | payment not found | - |
| | 409 | version conflict | - |
| | 500 | server failure | - |

Additional Response header includes payment location URL
Payment object MUST contain a valid id
Payment won't be updated, if payment in the database with the same id has a different version
